PHILIPS

Ingenia Ambition 1.5T X

MR services. Helium-free.

The Philips Ingenia Ambition offers cutting-edge MR imaging techniques to help you excel clinically every day. Based on its new, revolutionary fully sealed BlueSeal magnet, the solution lets you experience more productive¹ helium-free MR operations. Get superb image quality even for challenging patients, and perform your MRI exams up to 50% faster with Compressed SENSE acceleration for all anatomies in both 2D- and 3D scanning². Fast overall exam-time is achieved by simplifying patient handling at the bore with the touchless guided patient setup. There's always a way to make life better.

Welcome

Dear fellow MR-lovers,

Welcome to the 11th ISMRM Benelux chapter meeting!

We are especially proud to welcome you to the Stadsgehoorzaal in the beautiful city of Leiden. The Stadsgehoorzaal was completed in 1891, 127 years ago, and has since been used for concerts and entertainment events. As a neo-Renaissance architectural building, the Stadsgehoorzaal is one of a few in the Netherlands. Please walk into the Grote Zaal and the Breezaal paying attention to the interior: these two rooms are to date still originally decorated.

The ISMRM Benelux Chapter is known as a meeting that brings MR-lovers from Belgium, the Netherlands and this year also Luxembourg (welcome!) together. We, as the organizing committee, worked hard to make this day as inspiring and productive as possible. For that, we created a program to broaden your knowledge, meet fellow MR colleagues from the Benelux region and initiate a comfortable and professional atmosphere.

As every year, excellent junior researchers will have the chance to present their latest work during the power poster session. Six interesting parallel sessions have been put together with inspiring talks from young researchers about the latest advances in MR research, as well as two poster sessions. Have you noticed the new session names already?

We are being supported by our loyal sponsors, as well as some new sponsors this year! Please make sure to visit their booths during the poster sessions, coffee breaks and lunchtime. They are happy to talk about their work, inform you about new products and might even have job openings that could be of interest to some of you. This year we are also happy to announce four helpful and interesting workshops: Philips, Bruker, Proefschriftmaken & open science!

At the end of this exciting day, if you registered for the dinner, please join us at the Second Level. They will prepare a delicious buffet in a marvellous ambience for us. Additionally, we will have time to discuss new ideas, socialize and relax with our fellow Benelux colleagues.

Finally, we'd like to thank our sponsors, all the reviewers, moderators, the authors of all the abstracts and you for making this day possible.

Let's have fun and get inspired!

Antonia Kaiser,
on behalf of the organizing committee 2019!

Setting the pace in MR acceleration with Turbo Suite

Turbo Suite is comprised of three packages with unique parallel imaging, simultaneous multi-slice, and Compressed Sensing technologies that are tailored to your clinical need. And – with Turbo Suite, you gain access to future developments in MR acceleration, keeping you always up to date.

Reduce the total exam time by up to 50%

Routine exams in 10-15 minutes

Up to 50% time savings

Expand clinical capabilities

SIEMENS
Healthineers

SIGNA™ Premier

Today's clinical challenges are rapidly trending towards more specificity and sensitivity. SIGNA™ Premier was built with the consistency, power and intelligence to meet this growing trend. Adaptable technology gives you greater control over variability. And powerful performance allows you to expand your research while accelerating your clinical outcomes.

ISMRM Benelux Challenges 2019

Dear fellow MR-researchers,

After the success of last year, two new research grants will be awarded during this years' meeting! Applicants in two different categories were asked to come up with creative ideas and a detailed planning of the entire project.

Applications were scored in different domains and the top proposals of each category will be pitched at the plenary session. Three senior scientists from different institutes will jury the challenges and the winners of both categories will be awarded €25.000,- each!

Pioneer Award 2019

The ISMRM Benelux Pioneer Award 2019 is targeted at young and ambitious MR-scientists and provides PhD-students with the opportunity to independently carry out creative plans or ideas that are completely out-of-the box in an early phase of their career.

Women in MR Award 2019

Specifically thought for female researchers, the Women in MR Award aims to boost careers and create scientific opportunities. This challenge is sponsored by an NWO Aspasia grant to the Spinoza Centre for Neuroimaging, but non-neuro projects were more than welcome to apply!

We received almost two dozen applications from all areas of MR research this year. Two ambitious and exciting ideas per challenge are being presented today. The two winners will be awarded at the end of the day. The awarded winners will present their results at the 2020 meeting. If you are curious to know what the winners from last year have been doing, take a look at the schedule!

We would like to thank all applicants for their submissions, with a special thanks to the reviewers and today's jury members.

May the odds be with you - enjoy the challenges!

Venous Velocity Selective Inversion for OEF determination

C.J. Gorter Center, Radiology, Leiden University Medical Center, NL

For the ISMRM Benelux Out of the box challenge 2018 I proposed to develop a non-invasive method to image the oxygen extraction fraction (OEF) at tissue level for the whole brain. Current methods to measure the OEF have limited SNR and slice coverage, therefore OEF can only be determined in large veins. I implemented velocity-selective spin labeling inversion (VSI), and was able to target the post venular blood pool using pulsed ASL for arterial nulling and a multi-slice readout for whole brain coverage. By combining the venous VSI with a T2-preparation module the OEF could be estimated in the venous blood pool.

Abroad Internship Challenge

Gabriel Ramos-Llordén

Enabling higher acceleration rates in diffusion MRI by exploiting joint information from the k-q space: a GRAPPA-based methodology

Psychiatry Neuroimaging Laboratory, Brigham and Women's Hospital and Harvard Medical School, Boston, USA

Shortening the acquisition time of dMRI is a longstanding goal for the MRI community. Conventionally, dMRI is limited to in-plane acceleration factors of 2 or 3. Recent work has shown that higher acceleration rates may be obtained by exploiting information from coil-channels and redundancies across multiple images with different contrasts. In this presentation, we showcase an extended version of conventional GRAPPA reconstruction, where the missing k-space lines are learned not only from coil channels but also from k-space data acquired with different q-space points. Substantial gain in quality is achieved at high acceleration rates, where conventional GRAPPA usually breaks down.

Behavioural intervention in myotonic dystrophy type 1 assessed by longitudinal MRI of skeletal muscles*Department of Radiology, Radboud University Medical Center, Nijmegen, NL*

A behavioural intervention, directed to increase physical activity, had a beneficial effect on lower extremity muscle function in patients with myotonic dystrophy type 1 (DM1). Here, we evaluated potential causes of the effect of this intervention with quantitative MRI in the 20 lower extremity muscles of 27 DM1 patients. We showed that it leads to a ~4% average increase in muscle mass, especially in healthy appearing muscle. Fat infiltration was not decelerated. Therefore, we conclude that some muscles in DM1 patients are trainable, preferably early on in the course of the disease.

PP-002 Suzanne L. Franklin

The influence of the cardiac cycle on Velocity Selective and Acceleration Selective Arterial Spin Labeling, using retrospective triggering*C.J. Gorter Center for High Field MRI, Department of Radiology, Leiden University Medical Centre, Leiden, NL; Center for imaging sciences, University Medical Centre Utrecht, Utrecht, NL*

In this study, the influence of the cardiac cycle on the amount of label produced by velocity-selective (VSASL) and acceleration-selective arterial spin labeling (AccASL) was investigated. A sequence combining pCASL and VSASL(AccASL) was developed to isolate the arterial blood pool. Results showed significant arterial signal fluctuations in the amount of label produced by VSASL, AccASL and pCASL over the cardiac cycle. Hence, in order to become independent of the cardiac cycle, sufficient averages need to be taken when applying these techniques. Alternatively, these findings could be highly interesting for the purpose of quantifying pulsatility higher up in the vascular tree. physiological details beyond current resolution limitations.

PP-003 Gerhard Drenthen

T₂ relaxometry reveals frontal demyelination in children with childhood absence epilepsy*Department of Electrical Engineering, Eindhoven University of Technology, Eindhoven, NL; School for Mental Health and Neuroscience, Maastricht University Medical Center, Maastricht, NL; Department of Radiology and Nuclear Medicine, Maastricht University Medical Center, Maastricht, NL*

Childhood absence epilepsy (CAE) is characterized by daily occurring brief episodes of unconsciousness in otherwise normally developing children. While CAE is generally believed to be benign, previous studies revealed a higher incidence of attentional deficits. Moreover, previous diffusion weighted imaging (DWI) studies found structural abnormalities, suggesting that myelin might play a role. In this study, myelination was studied in children with CAE and controls, by applying myelin imaging using T₂ relaxometry. We found a decreased frontal myelin content in patients with CAE compared to controls. This is the first study to show an effect using a specific myelin modality.

Functional Magnetic Resonance Spectroscopy of response inhibition*Amsterdam University Medical Center, Vrije Universiteit, Amsterdam, NL*

Ten volunteers performed a Go/NoGo task during MRS acquisition at 7T to assess if event-related fMRS could detect dynamic glutamate changes during response inhibition. Metabolite spectra were acquired using a semiLASER sequence (to assess task-induced fluctuations in glutamate and lactate) and were interleaved with water-unsuppressed spectra (to assess the BOLD response-induced water linewidth changes). The voxel was placed in the dorsomedial prefrontal cortex. Although an fMRI pilot confirmed the voxel location, no significant differences in metabolite concentrations or water amplitude between NoGo and Go trials was detected.

PP-005

Rukun Hinz

Bottom-up sensory processing can decrease activity and functional connectivity in the default mode like network in rats*Bio-Imaging Lab, University of Antwerp, Antwerp, BE*

The default mode network is a large-scale brain network that is active during rest and deactivates as well as decreases its functional connectivity during externally oriented attention demanding cognitive tasks (top-down). However, it is not sufficiently understood whether attentional guidance by externally driven factors such as visual stimulation (bottom-up) could also result in similar reduction of activity and connectivity in the DMN. In this study we investigated whether bottom-up visual processing can influence the default mode network activity and its functional connectivity in rats.

This year, some of our sponsors are offering informative workshops in a short parallel session after lunch. The annual members meeting of our chapter, to which all participants of the meeting are invited, will also be held at the same time.

ISMRM Benelux Board - Annual Members Meeting - *Cornelis Schuytzaal*

In parallel to the sponsored workshops, the board of the ISMRM Benelux will host the annual members meeting of the ISMRM Benelux Chapter. During this year's meeting we will again discuss the current status of the Chapter. The meeting is open to everyone and especially to those willing to participate in future activities of the chapter! More specifically, the agenda points comprise an evaluation of the present and previous annual meeting, a financial report and a discussion on future activities. You are welcome to present your own ideas to bring our chapter into fruition.

Bruker Sponsored Workshop - *Breezaal*

'Pre-clinical imaging: prehistoric or prerequisite?'

The landscape for pre-clinical imaging has changed vastly over the last decade. Pre-clinical imaging has changed from pioneering MRI technological developments to wide-scale application in animal research and pharmacology. On the other hand, there are scientific discussions about data reproducibility and validity of animal models to study human disease, and political movements such as 'Proefdiervrije Innovatie' that have a large impact on our science. During this discussion, we will present the current scientific landscape and discuss with the attendees the steps that we may take to consolidate pre-clinical imaging research now and in the future.

Open Science Discussion - *Waalse Kerkfoyer*

Initiatives like OpenMR Benelux 2019 are important to promote growth, understanding and adoption of open science practices in the field of MRI in medicine. This one-day event (16 January 2019, Leiden) covers a range of topics related to open science in MRI (see the website for full talk abstracts). During the open science workshop on 17 January 2019, we will discuss this event and its successes/failures. Attendees will have the opportunity to be part of the discussion and to contribute towards future improvements. If you are interested in meeting likeminded students/researchers and joining the team that will organise the next OpenMR Benelux event, join us for this open science workshop!

Philips Sponsored Workshop - *Aalmarktzaal*

'Speed done right, every time'

To meet the increased demand for productivity, a technology breakthrough in acceleration is required. Leveraging our long-standing leadership position in speed (i.e. SENSE), Philips brings a breakthrough in productivity. Compressed SENSE is about accelerating full patient examinations and thus guaranteeing the next level in productivity and image quality to empower your staff to focus where it matters the most, enhanced patient care. During this workshop we will elaborate on the practical use of Compressed SENSE.

Proefschriftmaken Sponsored Workshop - *Jan Willem Schaapfoyer*

'Workshop Thesis Production'

The production of your thesis is a process that should be as smooth and stressless as possible. The workshop will focus on all the aspects of the process, including topics such as the designing, printing and publishing of your thesis, the time schedule and the costs.

This year, we introduce an exciting new poster session to highlight the excellent work done by our postdoc fellows in the Benelux. Make sure you spend some time visiting their posters and enjoy the fruitful discussion!

BP-001 - Anita Hartevelde

Towards systematic evaluation of velocity-selective ASL in the measurement of placental perfusion

Department of Radiology, University Medical Center Utrecht, Utrecht, NL

BP-002 - Chloé Najac

Estimating compartment- and cell-specific microscopic anisotropy in the human brain using double-diffusion encoding spectroscopy at 7T

C.J. Gorter Center for High Field MRI, Department of Radiology, Leiden University Medical Center, Leiden, NL

BP-003 - Evita Wieggers

Elevated brain glutamate levels in type 1 diabetes

Department of Radiology and Nuclear Medicine, Radboud university medical center, Nijmegen, NL

BP-004 - Esther Warnert

Voxelwise correlation between vascular parameters obtained with ASL and DSC as predictor of IDH-mutation status in non-enhancing glioma

Department of Radiology & Nuclear Medicine, Erasmus MC, Rotterdam, NL

BP-005 - Petra J. van Houdt

Quality assurance of quantitative MRI for biomarker discovery in locally advanced cervical cancer

Department of Radiation Oncology, the Netherlands Cancer Institute, Amsterdam, NL

BP-006 - Lionel Mignon

Hyperpolarized pyruvate-lactate exchange assesses metabolic shift in response to the EGFR inhibitor cetuximab in sensitive but not in resistant patient-derived HNSCC xenografts

Biomedical Magnetic Resonance Research Group, Louvain Drug Research Institute, Université Catholique de Louvain, Brussels, BE
